

End to End Software Solutions
For The Food Supply Chain

Quality And Food Safety Compliance Manager

BETTER MANAGEMENT OF A COMPREHENSIVE FOOD SAFETY SYSTEM

You depend on your food safety system to protect your customers as well as your brand equity. Consumers expect companies to be diligent in food safety, quality, consistency, and sustainability from farm all the way to the consumer's table.

The new Food Safety Modernization Act (FSMA) puts food safety and QA/QC executives in a position which requires more responsibility for the safety of the food supply chain whether home grown or imported. Additionally, the FSMA puts added pressure on having to update or change parts of the current program as new regulations and compliance measures are developed.

Over the past decade, the food industry has shifted from single-focus food safety steps to implementing comprehensive programs, yet many still struggle with melding the different components of a program together in an efficient way. Managing a food safety program is paper intensive, people intensive, process intensive, and expensive. So, how can companies build a repeatable, flexible, updatable, and affordable food supply chain process and ensure proper execution?

The answer lies in the ability to systemize food safety, quality assurance (QA), and quality control (QC) compliance as well

as capturing the defined activity of the workflow at the point of execution including Corrective Action Preventive Action (CAPA). Often discussion about automating food safety and quality revolves around turning existing paperwork into electronic data. A truly innovative discussion focuses on redesigning systems for operational efficiencies and managing business process workflow.

Taking this challenge head-on, N2N Global developed a comprehensive solution for the food industry which allows companies to accomplish more with less capital and in a more efficient manner. N2N's Quality and Food Safety Manager (QFSM) builds a single work flow database out of food safety, QA/QC, HACCP, SOP and other compliance requirements.

The broad and flexible nature of QFSM means it can be updated or changed quickly with transparency and consistency maintained. The single database permits workflows and critical

REACTIVE | PROACTIVE | PREVENTATIVE

“A comprehensive solution like QFSM enhances the effectiveness and efficiency of the food safety program”

limits to be changed in only one place, yet updated at all production locations and throughout all plans.

Companies using QFSM like Danish Crown, the second largest meat processor in the world, know with a high degree of confidence that their plans are being executed accurately and timely. The solution makes it easier for the food safety and QA/QC executive to manage all of the various compliance plans and spend more time on the effectiveness of the plan and less time on the execution of the plan. Additionally, alerts mitigate risk through effective decision making at the point of concern and drive continuous improvement through detailed analysis of correlations and exception reports.

A comprehensive solution like QFSM enhances the effectiveness and efficiency of the food safety program. It delivers value in brand equity by mitigating risk and increasing overall product quality and consistency for the end consumer. Companies that have implemented this solution have the tools needed to be reactive, proactive and preventative in their food safety and quality control operations. This allows QFSM users to

progress to higher food safety and quality standards while reducing the overall cost of their program.

client satisfaction. The winning solutions demonstrate maximum client value by addressing real business issues.

The value of this innovative approach is further witnessed by the fact that N2N received an IBM Beacon Award on February 16, 2011. This award recognizes IBM business partners who have raised the standard for delivering innovative solutions and exemplary

N2N Global Receives IBM Beacon Award for Outstanding Solution for Midsize Businesses

Fortunately, technology provides us with the means to combine food safety, quality and efficiency for the overall betterment of the food supply chain. As we move forward, we continue to seek the best solutions to protect consumers and our clients to provide the safest, highest quality food ■

For the past 28 years N2N Global has been an “End to End” food supply chain software solution provider. This focus has lead to innovative solutions for Agri-ERP, food safety management and Agri-Business Intelligence... delivering traceability, PTI compliance and increased value for all the participants of the food supply chain.
